

SEKHEM Installation Guide

Professional installation for the foldable wall-mounted 304 stainless-steel seat

Before installation

Installation must be completed by a qualified professional. The installer must verify that the wall and concealed services are suitable before drilling.

Suitable substrates include reinforced concrete, solid brick, and ceramic installed over concrete or solid masonry. Hollow block, gypsum board and weak walls require an engineered reinforcement solution.

Tools required

Drill and suitable masonry bit, level, measuring tape, pencil, spanners or socket set, safety glasses and appropriate personal protective equipment.

Installation steps

1. Select the mounting height and confirm comfortable access and clearance for the folding movement.
2. Hold the assembled seat level against the wall and accurately mark every fixing hole.
3. Check for concealed electrical, water and drainage services, then drill to the diameter and depth required for the supplied anchors.
4. Clean drilling dust from every hole. Install the supplied stainless-steel anchors and tighten the mounting plates evenly.
5. Confirm that all fixings are secure. Open and fold the seat repeatedly to check smooth, unobstructed movement.
6. Before first use, the installer must perform a controlled stability inspection appropriate to the wall and fixing system.

Important safety information

Do not install on an unsuitable wall. Do not use the seat if any fixing is loose, damaged or corroded. Never modify the frame, hinges or supplied fixing system. Incorrect installation and unsuitable wall construction are not covered by warranty.

Cleaning

Use mild soap, clean water and a soft cloth. Rinse and dry. Do not use chlorine, bleach, acids, steel wool or abrasive cleaners.
